

NEUR 411 Neuroethology

Fall 2026

Instructor

Jordan Lopez, M.D., Ph.D.
Professor of Psychology, Biological Sciences, Neurobiology & Biomedical Engineering
jlopez11@usc.edu
Office: Auditory Neuroscience Institute, Room ANI 208
Office Hours: Tuesdays and Thursdays 5 – 7 pm, Room ANI 208

Course Times & Locations

Component	Days & Times	Location
Lecture, Section 1	Mon / Wed / Fri, 9:00 to 10:50 AM	NEU 500
Lecture, Section 2	Mon / Wed / Fri, 5:30 to 7:20 PM	NEU 500
Laboratory	Lab Sections: Tue 11am – 1pm Tue 4pm – 6pm Wed 12pm – 2pm Thu 3pm – 5pm Fri 12pm – 2pm	 NEU LAB5A NEU LAB5B NEU LAB5A NEU LAB5B NEU LAB5A
Exams (4 total)	Mondays at 12:00 PM (dates in Course Calendar)	NEU 100A or NEU 100B

Course Description

Neuroethology sits at the intersection of neuroscience, ethology, and evolutionary biology. It asks how nervous systems generate the behaviors that allow animals to find food, avoid predators, navigate across landscapes, and communicate with conspecifics, and how those neural solutions have been shaped by natural selection. NEUR 411 examines this question through a series of case studies, each centered on a single animal system: insect vision and hearing, the escape circuits of crayfish and fish, bat and owl sound localization, electroreception in sharks and weakly electric fish, magnetic and chemical navigation, songbird vocal learning, and primate communication. Within each case, we consider the behavior the animal must perform, the neural circuitry that performs it, and the experiments that established the mechanism.

The course is organized around Tinbergen's four questions (causation, development, function, and evolution), which provide a framework for distinguishing how a behavior works from how it develops, why it persists, and how it arose. Students will learn to evaluate the experimental evidence behind these claims, to recognize the limits of that evidence, and to compare how different taxa solve the same ecological problem. The course draws on more than 1,000 articles reviewed in designing the curriculum.

As the field evolves rapidly, this course is structured to cover as much current research as possible within a demanding schedule. Students should expect a substantial and sustained workload. By the end of the semester, students should be able to articulate, with supporting evidence, the neural capabilities that allow animals to detect prey, localize sounds, navigate long distances, and communicate with one another, and to assess how well current models explain those capabilities.

Required Field Experience: Fall Recess

The Fall Recess Field Experience is a required, four-day neuroethology field trip from Thursday, October 8 through Sunday, October 11, 2026. The trip is educational. You will evaluate animal welfare and behavior scientifically, using the methods and concepts from lecture. It is not recreational tourism. Your job is to observe, critique, and understand what animals' environments and behaviors show about sensory processing, learning, stress, and enrichment. The host sites know we are coming and are prepared for us. There is no cost to students. All expenses are paid by the program. The trip is mandatory, and attendance on all four days is required.

- **Thursday, October 8:** Beckman Center for Conservation Research & San Diego Zoo Safari Park (Escondido, CA).
- Special topic: *Animal Behavior in Managed Environments I: Zoos (sensory ecology, neural mechanisms of stress, social behavior, enrichment, and neuroethical considerations of captivity).*

- **Friday, October 9:** Hubbs-SeaWorld Research Institute *&* SeaWorld Rescue & Rehabilitation Center (San Diego, CA). **We will carry out a neuroethical critique and behavioral audit.**
- *Special topic: Animal Behavior in Managed Environments II: Aquariums & Marine Theme Parks (underwater sensory environments, learning and reward systems, social communication, and neuroethical considerations of training and performance).*

- **Saturday, October 10:** Aquarium of the Pacific (Long Beach).
- *Special topic: Animal Behavior in Managed Environments III: Aquarium Sensory Worlds (visual, chemical, and mechanosensory processing, sensory adaptations, and how exhibit design shapes natural behavior)*

- **Sunday, October 11:** Marine Mammal Care Center for a few hours. Then head back to USC around 1-2pm
- *Special topic: Animal Behavior in Managed Environments IV: Rescue, Rehabilitation & Release (neurobiology of stress, behavioral/injury recovery, human habituation, and assessment of readiness for release)*

Overnight stays. We will stay overnight at the trip locations on each night of the trip, including the Aquarium of the Pacific. Bring a sleeping bag and whatever you need to sleep well, such as a sleeping pad, memory foam topper, pillow, and warm layers. The department will provide a limited number of sleeping bags from prior trips, but bring your own if you can.

Meals and schedule. Meals are provided by the program: breakfast at 9:00 AM, lunch at 1:00 PM, and dinner at 6:00 PM. For most of the day, you will have time to explore the sites and to learn directly from field biologists. After dinner, you will have free time.

Exams and evaluation. Field trip material will not be covered on exams. It will be evaluated through the Captivity and Conservation Reflection.

Absences. The trip is mandatory. An absence is excused only with documentation approved in advance. If you cannot attend or anticipate a conflict, contact me as soon as possible. The trip is costly and is planned in advance, so do not wait.

These four days appear in the Course Calendar as special topic sessions. We will meet as a class during the trip for informal discussions, animal observations, and group activities, with time to explore and enjoy the visits.

Participation is required on all four days (attendance will be taken and incorporated into your lab participation grade). No assignments are due during the trip

Prerequisites (Enforced)

[NEUROBIOLOGY PREREQUISITE & STATS COURSE/INTRODUCTORY STATISTICS]. Both are required. I will verify them at enrollment, and students without both will be dropped. You must be able to read a figure with error bars, interpret a significance test or regression output, and reason about cellular and systems neurophysiology from primary papers without being walked through each step. If you are hoping to catch up in the first three weeks, withdraw now.

Course Materials

There is no required textbook. Lecture slides are the primary source of instruction, and exams are based on lecture content. Recommended textbook: Zupanc, G. K. H. *Behavioral Neurobiology: An Integrative Approach* (3rd ed.). Oxford University Press, ISBN 978-0-19-873872-5. Alternative: Carew, T. J. (2000). *Behavioral Neurobiology: The Cellular Organization of Natural Behavior.* Sinauer.

Readings are listed in the Readings Calendar after the Course Calendar. They are recommended, not required. I will teach the material in lecture, and the readings are provided so that you can go deeper and succeed on exams.

Required equipment: a laptop capable of running Python or MATLAB for the simulation project, and a reliable connection to the course site. Software is free to install; instructions will be posted in Week 1.

Course Objectives

- Explain how sensory systems extract ecologically relevant information from the environment, and how that information is converted into motor output.
- Describe neural circuit mechanisms (identified neurons, central pattern generators, sensory maps, and neuromodulation) that generate specific animal behaviors.
- Evaluate experimental evidence from behavioral, electrophysiological, anatomical, and lesion studies, including its limitations.
- Compare solutions that different taxa use for the same problem, including convergent evolution.
- Design and communicate a quantitative analysis or model of a natural behavior using lab data or published results.

Teaching Assistants

This course has no co-instructor. Questions about lab logistics, lab reports, and grading should go to your TA first. Email the instructor only for issues that the TA cannot resolve.

Role	Name	Email	Office Hours / Location
Lab TA (Section M, TH)	Nicholas Xe	nicxe@usc.edu	Tue 1:00–3:00 PM, Thu 10:00 AM–12:00 PM, HNB107
Lab TA (Section 2)	Xavier Guden Lopez	Xavlop@usc.edu	Wed 2:30–4:30 PM, Fri 2:30–4:30 PM, HNB107
Exam Proctor	Dr. Luis Lemus Dr. Yahaira S Sanchez	lemus@usc.edu saraiy@usc.edu	Mondays, NEU 100A, 12:00 PM Mondays, NEU 100B, 12:00 PM

Grading

This course has two components, lecture and laboratory. Each is scored out of 100 percent. Your final grade is 50 percent lecture and 50 percent laboratory. **You must earn at least 60 percent in BOTH components to pass the course.** A strong lecture score does not rescue a failing lab score, and the reverse is also true.

Lecture Component (100%)

Assessment	Weight of Lecture Grade	Points
Exam 1 (Lectures 1 to 10)	20%	120
Exam 2 (Lectures 11 to 20)	20%	120
Exam 3 (Lectures 21 to 30)	20%	120
Exam 4 (Lectures 31 to 40)	20%	120
Lecture Project (simulation or APA paper)	20%	120
Total	100%	600

Laboratory Component (100%)

Assessment	Weight of Lab Grade
Lab Reports (8 counted of 10, 7.5% each)	60%
Lab Attendance and Participation	10%
Computational Assignments (3 at 5% each)	15%
Captivity and Conservation Reflection (5 pages)	15%
Total	100%

Dr. J’s Grading Philosophy and Curve

Neuroethology requires you to connect neural mechanisms with animal behavior, interpret experimental evidence, and compare findings across species. This is a demanding upper-division course. Memorizing terminology alone is not sufficient; you must be able to explain how a circuit works, evaluate the evidence supporting a proposed mechanism, and apply your understanding to unfamiliar experimental results.

Exams and laboratory assignments reflect these expectations. Some assessments will be difficult, and raw percentages may be lower than you are accustomed to. Grades reflect demonstrated understanding, scientific accuracy, and the quality of your reasoning. Consistent effort and participation are important, but they do not substitute for meeting the course’s academic standards.

If the final class average, calculated using the weighted lecture and laboratory grades before curving, is below 70%, a curve will be applied at the end of the course. If the class average is 70% or higher, no curve will be applied. The size of any adjustment will depend on overall class performance. A curve accounts for assessment difficulty while maintaining expectations for mastery; it does not guarantee a particular letter grade or a passing grade. Use early assessment results to identify gaps in your understanding, review feedback, and seek help promptly. Do not rely on a possible curve to compensate for missing work or consistently weak performance. You must still earn at least 60% in both the lecture and laboratory components to pass the course.

Grading Scale After Curving (changes year to year)

The percentage ranges below are approximate estimates, not fixed or guaranteed cutoffs. The grading scale may change from year to year, and final cutoffs for this semester may differ based on overall class performance and any curve applied under the policy above. Use this table as a general guide when estimating your grade.

Letter Grade	Approximate Percentage Range
A	90-100%
A-	85-89.9%
B+	80-84.9%
B	75-79.9%
B-	70-74.9%
C+	65-69.9%
C	60-64.9%
C-	55-59.9%

Letter Grade	Approximate Percentage Range
D	45-54.9%
F	Below 45%

Final grades are not rounded up. Letter grades will be assigned strictly according to the finalized cutoffs, which will be announced before final grades are assigned. Regardless of any adjustment to the scale, you must earn at least 60% in both the lecture and laboratory components to pass the course.

Exams

There are four exams, each worth 120 points, and each covers exactly ten lectures. Exam 1 covers Lectures 1 to 10, Exam 2 covers Lectures 11 to 20, Exam 3 covers Lectures 21 to 30, and Exam 4 covers Lectures 31 to 40. Exams are not cumulative, but the concepts build on one another, so later exams will assume you still know earlier material. Exams are given on Mondays at 12:00 PM in NEU 100A or NEU 100B, and they start on time.

- **Number of questions and versions:** Expect 80 questions on each exam. Each exam comes in three versions (V1, V2, and V3). The three versions contain the same questions, with the order of questions and answer choices mixed within each lecture section.
- **Question order:** Exam questions are ordered by lecture. Questions on Lecture 1 come first, followed by questions on Lecture 2, and so on through the last lecture covered by that exam.
- **Room and version assignment:** Before each exam, a randomized algorithm assigns every student to Room A (NEU 100A) or Room B (NEU 100B) and to one of three versions (V1, V2, or V3). Assignments are posted on the course site before the exam. Assignments are random, and requests to change them will not be accepted.
- **Exam format: In Person, Paper Exams** consisting primarily of written free-response questions and fill-in-the-blank questions, with a small number of multiple-choice questions. Written questions may require short answers, longer explanations, interpretation of figures and data, experimental design critiques, and cross-species comparisons.
- **Expectations for answers:** You must draw directly from lecture content, explain specific experimental findings, and provide relevant examples of animals, behaviors, and neural mechanisms. When asked to support an explanation, identify the evidence and explain how it supports your answer. Memorizing terminology or repeating slide text without demonstrating understanding is not sufficient.
- **Missed exams:** Make-up exams are not given. If you miss one exam, a zero will initially be recorded. If the absence is approved for a valid, documented medical or official reason, that zero will be replaced at the end of the semester by the average of your other three exam scores. This replacement uses your other exam scores, not your final course grade. An undocumented or unapproved absence will remain a zero.
- Bring a photo ID and a pencil (YOU WILL BE VERIFIED). Phones, smartwatches, and notes are not allowed
- **Exams are closed-note** unless the class negotiates an alternative at the beginning of the semester (and/or before Exam I). The class may negotiate permission to bring **one 8.5 × 11-inch handwritten reference sheet (double sided, OK). In exchange, the class agrees to replace the multiple-choice questions with additional fill in the blank questions (any change needs to be negotiated with the class as a whole)**. Reference sheets must be handwritten; typed or printed material is not permitted.

New lecture content is introduced on exam days. These lectures are shorter, but attendance is required, and the material will be covered on the next exam.

Lecture Project (20% of Lecture Grade)

Each student completes one project based on an animal system covered in class. Choose ONE option. Your choice is due with your proposal.

Option A: Simulation Project

Build a computational simulation of a neural circuit, sensory system, or behavior from one animal covered in lecture (for example, the cricket phonotaxis circuit, the Mauthner startle circuit, a CPG, or the owl ITD map). Models must be implemented in Python, MATLAB, or an equivalent tool. Deliverables: the working code (commented and runnable), a 5-page written report with the model's assumptions, parameter justification, validation against published data, and a discussion of where it fails, and a 5-minute recorded walkthrough. A model that cannot be compared with published data will not earn more than 70 percent of the project points.

Option B: 10-Page APA Paper

Write a 10-page paper in APA 7th edition format, excluding title page, abstract, and references, on one animal covered in class. The paper must synthesize at least 8 primary research articles, explain the neural mechanism and the behavior it produces, and critically evaluate the evidence. Summaries of individual papers will receive low marks. The paper must argue something.

Project Milestones

Milestone	Due
Proposal: animal, option chosen, one research question, and key references (1 page)	Fri Oct 30, 11:59 PM
Progress check: outline or working model with first results	Wed Nov 18, 11:59 PM
Final project submission	Fri Dec 11, 11:59 PM

Laboratory Component

The lab is a required, graded component and is not optional. Labs use recorded and published data, preserved specimens, and, where approved, live animal observation carried out under an institutional animal care protocol. You will complete animal welfare and lab safety training before Lab 1. Mishandling of animals, data, or equipment results in removal from the lab and a failing lab grade.

- **Lab Reports (10 labs, lowest 2 dropped, 7.5% each for the 8 counted).** Each report follows a standard format: Introduction, Methods, Results (with figures and statistics), Discussion, and References. Reports must be to 6-10 pages. Every quantitative claim requires a statistical test and an interpretation.
- **Lab Attendance and Participation (10%).** Attendance is required at every lab. Participation is earned by submitting your observations and data to Gradescope before you leave the lab. Submissions made after you leave will not be marked, and you will receive no participation credit for that lab. Excused absences require documentation submitted to the TA within 24 hours. Each unexcused absence reduces this grade by 15 points out of 100.
- **Computational Assignments (3 assignments, 5% each, 15% total).** Short Python or MATLAB problems covering data analysis and simulation that build the coding skills required for the simulation project. Due dates are in the schedule below.
- **Captivity and Conservation Reflection (15%).** A 5-page essay on your experience during the Fall Recess Field Experience and what you learned. Describe what you observed, evaluate the welfare and behavioral evidence scientifically, and explain what the visit taught you about how captive environments shape behavior. The essay is due Sat Nov 21. It is the best opportunity in the course to show you understand the biology, and it is also the one most students skip. Do not skip it.
- **Research use of this essay:** This essay is part of research on young students participating in active research, studying learning accessibility and disparities. Use of your essay in that research is voluntary.

Declining has no effect on your grade or on how your essay is scored. This statement applies only to the Captivity and Conservation Reflection.

Lab Schedule and Due Dates

Lab	Week	Topic	Due / Notes
Lab 1	Week 1	Ethograms and quantitative observation of cricket behavior	Report due Sun Sep 6
Lab 2	Week 2	Escape circuits: crayfish tail-flip and cockroach escape recordings	Report due Sun Sep 13
Lab 3	Week 4	Central pattern generators: rhythmic motor output from recorded nerve data	Report due Sun Sep 27
Lab 4	Week 5	Visual motion: optomotor response and motion detection	Report due Sun Oct 4
Lab 5	Week 6	Acoustic behavior: cricket phonotaxis and song recognition	Report due Sat Oct 17
Lab 6	Week 8	Sound localization: ITD and ILD from owl and cricket recordings	Report due Sun Oct 25
Lab 7	Week 9	Echolocation: bat call analysis and Doppler-shift measurement	Report due Sun Nov 1
Lab 8	Week 11	Electrosensory and chemosensory recordings	Report due Sun Nov 15
Lab 9	Week 12	Navigation: waggle dance decoding and path integration	Report due Sun Nov 22
Lab 10	Week 13	Vocal communication: songbird and frog call spectrograms	Report due Sun Nov 29
Make-up	Week 15	Make-up lab for students who missed a scheduled lab	-
Computational Assignment 1	Thu Sep 17	Python fundamentals, loading and plotting recordings, spike detection	Due 11:59 PM
Computational Assignment 2	Thu Oct 22	Signal analysis: power spectra and cross-correlation	Due 11:59 PM
Computational Assignment 3	Thu Nov 19	Simulation: a leaky integrate-and-fire neuron	Due 11:59 PM
Reflection Essay	Sat Nov 21	Captivity and Conservation Reflection (5 pages)	Due 11:59 PM

Lab section times and rooms are posted on the course site. The late work policy applies (see Late Work below).

Lecture Recordings and Study Materials

Lectures are recorded. Recordings are released **one week before the exam that covers them**. I may release them two weeks before an exam at my discretion, but early release is not guaranteed and should not be expected. You are responsible for attending lecture, taking thorough notes, and studying throughout the semester. **Do not wait for recordings to begin preparing for an exam.**

Recordings from previous offerings may also be posted as supplemental study materials. This course changes between semesters, and older recordings may omit current topics or include material that is no longer covered. **This semester's lectures determine what is examinable.** You are responsible for identifying those differences using the current lectures and slides.

Recordings do not replace attendance or excuse arriving unprepared. Lecture content is dense and requires consistent engagement. Choosing to rely on recordings does not reduce the material you are expected to know or change the standards by which your work will be graded.

Study Expectations

This course covers a lot of material on a fast schedule, and it will punish procrastination. Plan at least two hours of outside study for every hour of class. Review each lecture within 48 hours. Read the recommended papers for each lecture in the Readings Calendar. Work through the figures until you can explain the data without looking at the caption. Form study groups but make sure each of you can answer exam questions alone. Do not wait until the week of an exam to begin studying, and do not start the project the week it is due.

Lecture & Lab Attendance

Attendance at all lectures and labs is expected. Lectures introduce material that is not on the slides, and that material will appear on exams. There is no grade for lecture attendance, but missing lectures will affect your exam performance. Lab attendance is graded, and lab absences will not be excused without documentation.

Late Work

- **Lab reports, computational assignments, and the Captivity and Conservation Reflection:** 5% deduction per day late for the first 7 days. Work more than 1 week late is not accepted.
- **Lab participation:** observations and data must be submitted to Gradescope before you leave the lab. Submissions after you leave are not marked.
- **Lecture project:** 30% deduction for any submission after 11:59 PM on the due date. Projects submitted more than 48 hours late are not accepted.

Extensions are granted only for documented medical or emergency circumstances, and only if you contact me before the deadline. Asking for an extension the night before a deadline is not an emergency.

Academic Integrity and Use of AI Tools

Follow the university's standards of academic integrity. Cheating, plagiarism, unauthorized collaboration, and the use of unauthorized materials on exams will result in a zero on the work and a referral under university policy. Generative AI tools may not write any part of the lab reports, Captivity and Conservation Reflection, lecture project paper, or exam answers. You may use AI tools for coding assistance on the simulation project only if you disclose the use in your methods section and reference. ***Undisclosed use is a violation.***

Accommodations

Students with documented disabilities or other needs should contact the Office of Student Accessibility Services as early as possible. Once approved, provide me with your letter of accommodations so I can put it on file. Accommodations are honored only once they are approved and on file, and requests must be submitted at least 2 weeks prior to an exam.

Communication

Because this course involves complex, interdisciplinary concepts related to neural mechanisms and animal behavior, questions and clarification needs are expected. Students are strongly encouraged to use **Teaching Assistants as their first point of contact** for questions related to homework, labs, coding issues, and course logistics. TAs hold regular lab sessions and office hours and are well positioned to provide timely support. For questions that cannot be resolved with a TA, or for concerns related to unresolved grading disputes, accommodations, or broader course issues, students may contact the instructor at **jlopez11@usc.edu**.

I will make every effort to respond to emails and messages promptly; however, because I teach multiple courses and run an active research laboratory, response times may be delayed. Students should generally expect responses within **one business day**. Messages sent in the evening, overnight, or on weekends will typically be addressed the following business day. Use clear subject lines that include the course number and topic, such as “NEUR 411: Lab 3 report question.” Keep questions concise and include relevant context, such as the assignment name or lab section. **Reach out early rather than waiting until deadlines or exam days.** Consult the syllabus and current lecture materials for exam coverage before emailing.

Absences and Communication

I understand that many students balance academic responsibilities with work, family obligations, and other commitments. Communication is key. If you anticipate an absence or experience a documented emergency, **please email me as soon as possible**. For lab absences, also notify your TA and submit documentation within 24 hours, as required by the laboratory attendance policy. Being proactive and communicative helps me support you throughout the semester.

Unexcused lab absences will affect your Lab Attendance and Participation grade under the laboratory attendance policy, regardless of access to lecture recordings. There is no separate lecture attendance grade, but you remain responsible for all missed lecture content. Recordings are provided as a supplement and do not replace in-person participation. Missed exams remain subject to the missed-exam policy.

Course Calendar

All dates are final unless announced in class and posted on the course site. Lectures meet Monday, Wednesday, and Friday, 1 hour and 50 minutes per meeting. Exams are Mondays at 12:00 PM in NEU 100A or NEU 100B. Lab meeting weeks and report due dates are listed in the Lab Schedule above.

Date (2026)	Session	Topic	Assessment / Notes
Week 1	Lab 1	Lab 1 meets: ethograms and quantitative observation of cricket behavior	*Must have approval by IACUC before entering lab*
Mon Aug 24	Lecture 1	Introduction to neuroethology: Tinbergen's four questions; proximate vs. ultimate causation	Will NOT review Syllabus (review on your own)
Wed Aug 26	Lecture 2	Fixed action patterns and sign stimuli: Lorenz and Tinbergen's stickleback and graylag goose work	
Fri Aug 28	Lecture 3	Cockroach escape: the cercal system and giant interneurons (Camhi)	
Week 2	Lab 2	Lab 2 meets: escape circuits: crayfish tail-flip and cockroach escape recordings	
Mon Aug 31	Lecture 4	Crayfish tail-flip: lateral and medial giant fiber circuits (Wine & Krasne)	
Wed Sep 2	Lecture 5	Fish startle: the Mauthner cell and the C-start response (Eaton & Faber)	
Fri Sep 4	Lecture 6	Central pattern generators I: leech swimming and crawling (Kristan)	
Sun Sep 6	Lab 1	Lab 1 report due	Report due
Mon Sep 7	No class	Labor Day	
Wed Sep 9	Lecture 7	Central pattern generators II: the lobster/crab stomatogastric ganglion (Marder & Selverston)	
Fri Sep 11	Lecture 8	Locust flight: wind-sensitive interneurons and the flight CPG	
Week 4	Lab 3	Lab 3 meets: central pattern generators: rhythmic motor output from recorded nerve data	
Sun Sep 13	Lab 2	Lab 2 report due	Report due
Mon Sep 14	Lecture 9	Amphibian prey capture I: toad visual prey-catching and tectal feature detectors (Ewert)	
Wed Sep 16	Lecture 10	Amphibian prey capture II: pretectal predator-avoidance circuits	
Thu Sep 17	Comp. 1	Computational Assignment 1: python fundamentals, loading and plotting recordings, spike detection	Due 11:59 PM
Fri Sep 18	Lecture 11	Insect vision I: the fly optomotor response and the Reichardt elementary motion detector	
Week 5	Lab 4	Lab 4 meets: visual motion: optomotor response and motion detection	
Mon Sep 21	Lecture 12	Insect vision II: jumping spider eyes and predatory tracking (Land)	
Mon Sep 21	**Exam 1**	**Covers Lectures 1 to 10**	**12:00 PM, NEU 100A or NEU 100B**
Wed Sep 23	Lecture 13	Mantis shrimp vision: hyperspectral and polarization sensing	

Date (2026)	Session	Topic	Assessment / Notes
Fri Sep 25	Lecture 14	Insect hearing I: cricket phonotaxis and song recognition (Hoy)	
Week 6	Lab 5	Lab 5 meets: acoustic behavior: cricket phonotaxis and song recognition	
Sun Sep 27	Lab 3	Lab 3 report due	Report due
Mon Sep 28	Lecture 15	Insect hearing II: moth ears and bat-evasion behavior (Roeder)	
Wed Sep 30	Lecture 16	Bat echolocation I: CF-FM bats and Doppler-shift compensation (Suga)	
Fri Oct 2	Lecture 17	Bat echolocation II: FM bats, target-range computation, clutter rejection	
Sun Oct 4	Lab 4	Lab 4 report due	Report due
Mon Oct 5	Lecture 18	Owl sound localization I: ITD/ILD maps in the inferior colliculus (Konishi & Knudsen)	
Wed Oct 7	Lecture 19	Owl sound localization II: developmental plasticity of the auditory map	
Thu Oct 8	Special Topic Location	Animal Behavior in Managed Environments I: Zoos (sensory ecology, neural mechanisms of stress, social behavior, enrichment, and neuroethical considerations of captivity). *Beckman Center for Conservation Research & San Diego Zoo Safari Park*	Field Experience (required)
Fri Oct 9	Special Topic Location	Animal Behavior in Managed Environments II: Aquariums & Marine Theme Parks (underwater sensory environments, learning and reward systems, social communication, and neuroethical considerations of training and performance) *Hubbs Research Institute & SeaWorld Rescue & Rehabilitation Center*	Field Experience (required)
Sat Oct 10	Special Topic Location	Animal Behavior in Managed Environments III: Aquarium Sensory Worlds (visual, chemical, and mechanosensory processing, sensory adaptations, and how exhibit design shapes natural behavior) *Aquarium of the Pacific*	Field Experience (required)
Sun Oct 11	Special Topic Location	Animal Behavior in Managed Environments IV: Rescue, Rehabilitation & Release (neurobiology of stress and injury, behavioral recovery, human habituation, and assessment of readiness for release) *Marine Mammal Care Center*	Field Experience (required)
Week 8	Lab 6	Lab 6 meets: sound localization: ITD and ILD from owl and cricket recordings	
Mon Oct 12	Lecture 20	Electroreception I: passive sensing in sharks and rays (ampullae of Lorenzini)	
Wed Oct 14	Lecture 21	Electroreception II: active electrolocation in weakly electric fish (Bullock)	
Fri Oct 16	Lecture 22	Electroreception III: the jamming avoidance response (Heiligenberg)	
Week 9	Lab 7	Lab 7 meets: echolocation: bat call analysis and Doppler-shift measurement	
Sat Oct 17	Lab 5	Lab 5 report due	Report due
Mon Oct 19	Lecture 23	Magnetoreception: sea turtle and migratory bird magnetic compasses	
Mon Oct 19	Exam 2	Covers Lectures 11 to 20	12:00 PM, NEU 100A or NEU 100B
Wed Oct 21	Lecture 24	Chemoreception I: silkmoth pheromone plume-tracking (Kramer & Cardé)	

Date (2026)	Session	Topic	Assessment / Notes
Thu Oct 22	Comp. 2	Computational Assignment 2: signal analysis: power spectra and cross-correlation	Due 11:59 PM
Fri Oct 23	Lecture 25	Chemoreception II: lobster olfactory search behavior	
Sun Oct 25	Lab 6	Lab 6 report due	Report due
Mon Oct 26	Lecture 26	Tactile specialization: the star-nosed mole's tactile fovea (Catania)	
Wed Oct 28	Lecture 27	Archerfish: predictive aiming and ballistic prey capture	
Fri Oct 30	Lecture 28	Navigation I: desert ant path integration (Wehner)	Project proposal due 11:59 PM
Week 11	Lab 8	Lab 8 meets: electrosensory and chemosensory recordings	
Sun Nov 1	Lab 7	Lab 7 report due	Report due
Mon Nov 2	Lecture 29	Navigation II: honeybee waggle dance and sun-compass navigation (von Frisch)	
Wed Nov 4	Lecture 30	Navigation III: monarch butterfly migration and the circadian sun compass	
Fri Nov 6	Lecture 31	Navigation IV: homing pigeon multimodal navigation	
Week 12	Lab 9	Lab 9 meets: navigation: waggle dance decoding and path integration	
Mon Nov 9	Lecture 32	Vocal communication I: songbird song-system anatomy (HVC, RA, Area X, LMAN)	
Mon Nov 9	Exam 3	Covers Lectures 21 to 30	12:00 PM, NEU 100A or NEU 100B
Wed Nov 11	No class	No class (per schedule)	
Fri Nov 13	Lecture 33	Vocal communication II: song learning, sensitive periods, and the template model (Marler & Konishi)	
Week 13	Lab 10	Lab 10 meets: vocal communication: songbird and frog call spectrograms	
Sun Nov 15	Lab 8	Lab 8 report due	Report due
Mon Nov 16	Lecture 34	Vocal communication III: Drosophila courtship song and the fruitless circuit	
Wed Nov 18	Lecture 35	Social behavior: crayfish dominance and serotonergic modulation of escape	Project progress check due 11:59 PM
Thu Nov 19	Comp. 3	Computational Assignment 3: simulation: a leaky integrate-and-fire neuron	Due 11:59 PM
Fri Nov 20	Lecture 36	Simple learning circuits: Aplysia gill-withdrawal habituation and sensitization (Kandel)	
Sun Nov 22	Lab 9	Lab 9 report due	Report due
Sat Nov 21	Reflection Essay	Captivity and Conservation Reflection (5 pages) due	Due 11:59 PM
Mon Nov 23	Lecture 37	Spatial cognition: hippocampal place cells and grid cells (O'Keefe & Moser)	
Wed Nov 25	No class	No class meeting (Thanksgiving week)	
Sun Nov 29	Lab 10	Lab 10 report due	Report due
Week 15	Make-up	Make-up lab for students who missed a scheduled lab	
Mon Nov 30	Lecture 38	Primate communication: vervet monkey alarm calls and referential signaling (Seyfarth & Cheney)	
Wed Dec 2	Lecture 39	Hormones and behavior: the ring dove reproductive cycle (Lehrman) and seasonal song plasticity	
Fri Dec 4	Lecture 40	Frontiers: optogenetics, wireless recording, and causal tests of neural circuits	

Date (2026)	Session	Topic	Assessment / Notes
Mon Dec 7	Exam 4	Covers Lectures 31 to 40	12:00 PM, NEU 100A or NEU 100B
Fri Dec 11	Project	Lecture project final submission	Due 11:59 PM

Readings Calendar

The readings below are recommended, not required. Each lecture lists the papers it draws on, taken from the reference lists in the lecture decks. Read them before lecture when you can, and use them to go deeper than the slides. I will teach the material in class.

Date (2026)	Session	Topic	Recommended Readings
Mon Aug 24	Lecture 1	Introduction to neuroethology: Tinbergen's four questions; proximate vs. ultimate causation	J.R. Barber; D. Plotkin; J.J. Rubin; N.T. Homziak; B.C. Leavell; P.R. Houlihan; K.A. Miner; J.W. Breinholt; B. Quirk-Royal; P.S. Padrón; M. Nunez; A.Y. Kawahara (2022). Anti-bat ultrasound production in moths is globally and phylogenetically widespread. Proceedings of the National Academy of Sciences 119(25):e2117485119. https://doi.org/10.1073/pnas.2117485119 M.J. Cormons; J. Zeil (2023). Digger wasps Microbembex monodonta SAY (Hymenoptera, Crabronidae) rely exclusively on visual cues when pinpointing their nest entrances. PLOS ONE 18(3):e0282144. https://doi.org/10.1371/journal.pone.0282144 N. Tinbergen (1963). On aims and methods of Ethology. Zeitschrift für Tierpsychologie 20:410–433. https://doi.org/10.1111/j.1439-0310.1963.tb01161.x O. Fehér; H. Wang; S. Saar; P.P. Mitra; O. Tchernichovski (2009). De novo establishment of wild-type song culture in the zebra finch. Nature 459(7246):564–568. https://doi.org/10.1038/nature07994
Wed Aug 26	Lecture 2	Fixed action patterns and sign stimuli: Lorenz and Tinbergen's stickleback and graylag goose work	K. Lorenz; N. Tinbergen (1938). Taxis und Instinkthandlung in der Eirollbewegung der Graugans. I. Zeitschrift für Tierpsychologie 2(1):1–29. Archive edition identifies 1938; Crossref indexes this DOI under 1939. https://doi.org/10.1111/j.1439-0310.1939.tb01558.x N. Tinbergen (1948). Social Releasers and the Experimental Method Required for Their Study. The Wilson Bulletin 60(1):6–51. Digitized article; repository DOI. https://doi.org/10.5281/zenodo.16185673 N. James; A. Bell (2021). Minimally invasive brain injections for viral-mediated transgenesis: New tools for behavioral genetics in sticklebacks. PLOS ONE 16(5):e0251653. https://doi.org/10.1371/journal.pone.0251653 S.A. Bukhari; M.C. Saul; C.H. Seward; H. Zhang; M. Bensky; N. James; S.D. Zhao; S. Chandrasekaran; L. Stubbs; A.M. Bell (2017). Temporal dynamics of neurogenomic plasticity in response to social interactions in male threespined sticklebacks. PLOS Genetics 13(7):e1006840. https://doi.org/10.1371/journal.pgen.1006840
Fri Aug 28	Lecture 3	Cockroach escape: the cercal system and giant interneurons (Camhi)	Booth, D., Marie, B., Domenici, P., Blagburn, J. M., & Bacon, J. P. (2009). Transcriptional control of behavior: engrailed knock-out changes cockroach escape trajectories. Journal of Neuroscience, 29(22), 7181–7190. https://doi.org/10.1523/JNEUROSCI.1374-09.2009 Camhi, J. M., Tom, W., & Volman, S. (1978). The escape behavior of the cockroach Periplaneta americana. II. Detection of natural predators by air displacement. Journal of Comparative Physiology, 128, 203–212. https://doi.org/10.1007/BF00656853 Camhi, J. M., & Tom, W. (1978). The escape behavior of the cockroach Periplaneta americana. I. Turning

Date (2026)	Session	Topic	Recommended Readings
			response to wind puffs. Journal of Comparative Physiology, 128, 193–201. https://doi.org/10.1007/BF00656852 Olsen, A. C. K., & Triblehorn, J. D. (2014). Neural responses from the filiform receptor neuron afferents of the wind-sensitive cercal system in three cockroach species. Journal of Insect Physiology, 68, 76–86. https://doi.org/10.1016/j.jinsphys.2014.07.002
Mon Aug 31	Lecture 4	Crayfish tail-flip: lateral and medial giant fiber circuits (Wine & Krasne)	J. Herberholz; S. H. Mishra; D. Uma; M. W. Germann; D. H. Edwards; K. Potter (2011). Non-invasive imaging of neuroanatomical structures and neural activation with high-resolution MRI. Frontiers in Behavioral Neuroscience 5:16. https://doi.org/10.3389/fnbeh.2011.00016 J. J. Wine; F. B. Krasne (1972). The Organization of Escape Behaviour in the Crayfish. Journal of Experimental Biology 56(1):1–18. https://doi.org/10.1242/jeb.56.1.1 M. E. Swierzbinski; J. Herberholz (2018). Effects of ethanol on sensory inputs to the medial giant interneurons of crayfish. Frontiers in Physiology 9:448. https://doi.org/10.3389/fphys.2018.00448 J. Herberholz; B. L. Antonsen; D. H. Edwards (2002). A lateral excitatory network in the escape circuit of crayfish. Journal of Neuroscience 22(20):9078–9085. https://doi.org/10.1523/JNEUROSCI.22-20-09078.2002
Wed Sep 2	Lecture 5	Fish startle: the Mauthner cell and the C-start response (Eaton & Faber)	Eaton RC, Bombardieri RA, Meyer DL (1977). The Mauthner-initiated startle response in teleost fish. Journal of Experimental Biology 66: 65–81. https://doi.org/10.1242/jeb.66.1.65 Eaton RC, DiDomenico R, Nissanov J (1988). Flexible body dynamics of the goldfish C-start: implications for reticulospinal command mechanisms. Journal of Neuroscience 8(8): 2758–2768. https://doi.org/10.1523/JNEUROSCI.08-08-02758.1988 Schuster S (2023). The archerfish predictive C-start. Journal of Comparative Physiology A 209(5): 827–837. https://doi.org/10.1007/s00359-023-01658-2 Burgess HA, Granato M (2007). Sensorimotor gating in larval zebrafish. Journal of Neuroscience 27(18): 4984–4994. https://doi.org/10.1523/JNEUROSCI.0615-07.2007
Fri Sep 4	Lecture 6	Central pattern generators I: leech swimming and crawling (Kristan)	M. Ashaber; Y. Tomina; P. Kassraian; E. A. Bushong; W. B. Kristan Jr; M. H. Ellisman; D. A. Wagenaar (2021). Anatomy and activity patterns in a multifunctional motor neuron and its surrounding circuits. eLife 10:e61881. https://doi.org/10.7554/eLife.61881 K. L. Briggman; W. B. Kristan Jr (2006). Rozenshteyn; W. B. Kristan Jr (2000). Kinematics and modeling of leech crawling: evidence for an oscillatory behavior produced by propagating waves of excitation. Journal of Neuroscience 20(4):1643–1655. https://doi.org/10.1523/JNEUROSCI.20-04-01643.2000 W. B. Kristan Jr; R. L. Calabrese (1976). Rhythmic swimming activity in neurones of the isolated nerve cord of the leech. Journal of Experimental Biology 65(3):643–668. https://doi.org/10.1242/jeb.65.3.643
Wed Sep 9	Lecture 7	Central pattern generators II: the lobster/crab stomatogastric ganglion (Marder & Selverston)	Powell D, Haddad SA, Gorur-Shandilya S, Marder E. (2021). Coupling between fast and slow oscillator circuits in Cancer borealis is temperature-compensated. eLife 10: e60454. https://doi.org/10.7554/elife.60454 Garcia VJ, Daur N, Temporal S, Schulz DJ, Bucher D.

Date (2026)	Session	Topic	Recommended Readings
			(2015). Neuropeptide receptor transcript expression levels and magnitude of ionic current responses show cell type-specific differences in a small motor circuit. Journal of Neuroscience 35: 6786-6800. https://doi.org/10.1523/jneurosci.0171-15.2015 Miller JP, Selverston AI. (1982). Mechanisms underlying pattern generation in lobster stomatogastric ganglion as determined by selective inactivation of identified neurons. II. Oscillatory properties of pyloric neurons. Journal of Neurophysiology 48: 1378-1391. https://doi.org/10.1152/jn.1982.48.6.1378 Hooper SL, Marder E. (1987). Modulation of the lobster pyloric rhythm by the peptide proctolin. Journal of Neuroscience 7: 2097-2112. https://doi.org/10.1523/jneurosci.07-07-02097.1987
Fri Sep 11	Lecture 8	Locust flight: wind-sensitive interneurons and the flight CPG	J. M. Camhi (1969c). Locust wind receptors. III. Contribution to flight initiation and lift control. Journal of Experimental Biology 50(2):363–373. https://doi.org/10.1242/jeb.50.2.363 D. M. Wilson (1961). The central nervous control of flight in a locust. Journal of Experimental Biology 38(2):471–490. https://doi.org/10.1242/jeb.38.2.471 E. Buhl; K. Schildberger; P. A. Stevenson (2008). A muscarinic cholinergic mechanism underlies activation of the central pattern generator for locust flight. Journal of Experimental Biology 211(14):2346–2357. https://doi.org/10.1242/jeb.017384 J. M. Camhi (1969a). Locust wind receptors. I. Transducer mechanics and sensory response. Journal of Experimental Biology 50(2):335–348. https://doi.org/10.1242/jeb.50.2.335
Mon Sep 14	Lecture 9	Amphibian prey capture I: toad visual prey-catching and tectal feature detectors (Ewert)	Ewert JP, Buxbaum-Conradi H, Dreisvogt F, Glagow M, Merkel-Harff C, Röttgen A, Schürg-Pfeiffer E, Schwippert WW (2001). Neural modulation of visuomotor functions underlying prey-catching behaviour in anurans: perception, attention, motor performance, learning. Comparative Biochemistry and Physiology A 128: 417–461. https://doi.org/10.1016/S1095-6433(00)00333-0 Ewert JP, Arend B, Becker V, Borchers HW (1979). Invariants in configurational prey selection by Bufo bufo (L.). Brain, Behavior and Evolution 16: 38–51. https://doi.org/10.1159/000121822 Ewert JP (1997). Neural correlates of key stimulus and releasing mechanism: a case study and two concepts. Trends in Neurosciences 20(8): 332–339. https://doi.org/10.1016/S0166-2236(96)01042-9 Schürg-Pfeiffer E, Ewert JP (1981). Investigation of neurons involved in the analysis of gestalt prey features in the frog Rana temporaria. Journal of Comparative Physiology 141: 139–152. https://doi.org/10.1007/BF01342660
Wed Sep 16	Lecture 10	Amphibian prey capture II: pretectal predator-avoidance circuits	Ewert JP (1970). Neural mechanisms of prey-catching and avoidance behavior in the toad (Bufo bufo L.). Brain, Behavior and Evolution 3(1–4):36–56. https://doi.org/10.1159/000125462 Ingle D (1973). Disinhibition of tectal neurons by pretectal lesions in the frog. Science 180(4084):422–424. https://doi.org/10.1126/science.180.4084.422 Laming PR, Ewert JP (1983). The effects of pretectal lesions on neuronal, sustained potential shift and electroencephalographic responses of the toad tectum to presentation of a visual stimulus. Comparative Biochemistry and Physiology Part A: Physiology 76(2):247–252. https://doi.org/10.1016/0300-9629(83)90322-5 Schwippert WW, Beneke TW, Ewert JP (1995). Pretecto-tectal influences. II. How retinal and pretectal inputs to

Date (2026)	Session	Topic	Recommended Readings
			the toad's superficial tectum interact: a study of electrically evoked field potentials. Journal of Comparative Physiology A 176(2):181–192. https://doi.org/10.1007/BF00239921
Fri Sep 18	Lecture 11	Insect vision I: the fly optomotor response and the Reichardt elementary motion detector	Mano O, Choi M, Tanaka R, Creamer MS, Matos NCB, Shomar JW, Badwan BA, Clandinin TR, Clark DA (2023). Long-timescale anti-directional rotation in Drosophila optomotor behavior. eLife 12:e86076. https://doi.org/10.7554/elife.86076 Duistermars BJ, Chow DM, Condro M, Frye MA (2007). The spatial, temporal and contrast properties of expansion and rotation flight optomotor responses in Drosophila. Journal of Experimental Biology 210:3218-3227. https://doi.org/10.1242/jeb.007807 Hassenstein B, Reichardt W (1956). Systemtheoretische Analyse der Zeit-, Reihenfolgen- und Vorzeichenauswertung bei der Bewegungsperzeption des Rüsselkäfers Chlorophanus. Zeitschrift für Naturforschung B 11:513–524. https://doi.org/10.1515/znb-1956-9-1004 Clark DA, Bursztyn L, Horowitz MA, Schnitzer MJ, Clandinin TR (2011). Defining the computational structure of the motion detector in Drosophila. Neuron 70:1165-1177. https://doi.org/10.1016/j.neuron.2011.05.023
Mon Sep 21	Lecture 12	Insect vision II: jumping spider eyes and predatory tracking (Land)	Zurek DB, Cronin TW, Taylor LA, Byrne K, Sullivan MLG, Morehouse NI (2015). Spectral filtering enables trichromatic vision in colorful jumping spiders. Current Biology 25: R403–R404. https://doi.org/10.1016/j.cub.2015.03.033 Zurek DB, Taylor AJ, Evans CS, Nelson XJ (2010). The role of the anterior lateral eyes in the vision-based behaviour of jumping spiders. Journal of Experimental Biology 213: 2372–2378. https://doi.org/10.1242/jeb.042382 Land MF (1969a). Structure of the retinae of the principal eyes of jumping spiders (Salticidae: Dendryphantinae) in relation to visual optics. Journal of Experimental Biology 51: 443–470. https://doi.org/10.1242/jeb.51.2.443 Nagata T, Koyanagi M, Tsukamoto H, Saeki S, Isono K, Shichida Y, Tokunaga F, Kinoshita M, Arikawa K, Terakita A (2012). Depth perception from image defocus in a jumping spider. Science 335: 469–471. https://doi.org/10.1126/science.1211667
Wed Sep 23	Lecture 13	Mantis shrimp vision: hyperspectral and polarization sensing	Bok MJ, Roberts NW, Cronin TW (2018). Behavioural evidence for polychromatic ultraviolet sensitivity in mantis shrimp. Proceedings of the Royal Society B: Biological Sciences 285: 20181384. https://doi.org/10.1098/rspb.2018.1384 Thoen HH, How MJ, Chiou TH, Marshall J (2014). A Different Form of Color Vision in Mantis Shrimp. Science 343: 411-413. https://doi.org/10.1126/science.1245824 Wang CWJ, Marshall NJ (2025). Behavioural evidence of spectral opponent processing in the visual system of stomatopod crustaceans. Journal of Experimental Biology 228: jeb247952. https://doi.org/10.1242/jeb.247952 Kleinlogel S, White AG (2008). The Secret World of Shrimps: Polarisation Vision at Its Best. PLoS ONE 3: e2190. https://doi.org/10.1371/journal.pone.0002190
Fri Sep 25	Lecture 14	Insect hearing I: cricket phonotaxis and song recognition (Hoy)	Pollack GS, Hoy RR (1979). Temporal pattern as a cue for species-specific calling song recognition in crickets. Science 204(4391):429–432. https://doi.org/10.1126/science.204.4391.429 Kostarakos K, Hedwig B (2012). Calling song recognition in female crickets: temporal tuning of identified brain

Date (2026)	Session	Topic	Recommended Readings
			neurons matches behavior. Journal of Neuroscience 32(28):9601–9612. https://doi.org/10.1523/JNEUROSCI.1170-12.2012 Hoy RR, Paul RC (1973). Genetic control of song specificity in crickets. Science 180(4081):82–83. https://doi.org/10.1126/science.180.4081.82 Michelsen A, Popov AV, Lewis B (1994). Physics of directional hearing in the cricket Gryllus bimaculatus. Journal of Comparative Physiology A 175:153–164. https://doi.org/10.1007/BF00215111
Mon Sep 28	Lecture 15	Insect hearing II: moth ears and bat-evasion behavior (Roeder)	Moir HM, Jackson JC, Windmill JFC (2013). Extremely high frequency sensitivity in a 'simple' ear. Biology Letters 9: 20130241. https://doi.org/10.1098/rsbl.2013.0241 Roeder KD (1962). The behaviour of free flying moths in the presence of artificial ultrasonic pulses. Animal Behaviour 10: 300-304. https://doi.org/10.1016/0003-3472(62)90053-2 Corcoran AJ, Conner WE (2016). How moths escape bats: predicting outcomes of predator-prey interactions. Journal of Experimental Biology 219: 2704–2715. https://doi.org/10.1242/jeb.137638 Roeder KD, Treat AE (1957). Ultrasonic reception by the tympanic organ of noctuid moths. Journal of Experimental Zoology 134: 127-157. https://doi.org/10.1002/jez.1401340107
Wed Sep 30	Lecture 16	Bat echolocation I: CF-FM bats and Doppler-shift compensation (Suga)	Schoeppler D, Schnitzler H-U, Denzinger A (2018). Precise Doppler shift compensation in the hipposiderid bat, Hipposideros armiger. Scientific Reports 8:4598. https://doi.org/10.1038/s41598-018-22880-y Suga N, Simmons JA, Jen PH-S (1975). Peripheral specialization for fine analysis of Doppler-shifted echoes in the auditory system of the "CF-FM" bat Pteronotus parnellii. Journal of Experimental Biology 63(1):161–192. https://doi.org/10.1242/jeb.63.1.161 Schuller G, Beuter K, Schnitzler H-U (1974). Response to frequency shifted artificial echoes in the bat Rhinolophus ferrumequinum. Journal of Comparative Physiology 89(3):275–286. https://doi.org/10.1007/BF00696191 Metzner W, Zhang S, Smotherman M (2002). Doppler-shift compensation behavior in horseshoe bats revisited: auditory feedback controls both a decrease and an increase in call frequency. Journal of Experimental Biology 205(11):1607–1616. https://doi.org/10.1242/jeb.205.11.1607
Fri Oct 2	Lecture 17	Bat echolocation II: FM bats, target-range computation, clutter rejection	Bates ME, Simmons JA, Zorikov TV (2011). Bats use echo harmonic structure to distinguish their targets from background clutter. Science 333(6042):627–630. https://doi.org/10.1126/science.1202065 Ming C, Bates ME, Simmons JA (2020). Final Word

This course is hard, and it is designed to be. Neuroethology asks you to think like a biologist, an engineer, and a skeptic at the same time. If you do the reading, show up to lecture and lab, and start early, you will leave with a working understanding of how animals sense and act on their worlds. If you do not, the schedule will catch up with you by the first exam. Plan accordingly.
